

Tool-Use Summary

Santheesh S | Mystri Track B | Product 1 (DICM Core) | 3 h 50 min (230 min) total effort

I built a dry-run rules pipeline on Mystri pack data, documented the decision in **DECISION.md**, and gated submission with **python product1\verify_product1.py (> PRODUCT 1 PASS)**. Below is how I used tools and how I verified or overruled their output.

Tools I used (mandatory disclosure)

Tool	What I used it for	How I checked, corrected, or rejected output
Cursor — Composer (AI coding assistant in the IDE)	Scaffolded queue_engine.py, parts of integrated pipeline, product1\verify_product1.py, changes to event_engine.py, and event_engine.py	Added each subsystem to change baseline and verify if it updates the DICM Core
Python 3.10+ (stdlib only)	Loader, experiment.py, integrated pipeline, product1\verify_product1.py, changes to event_engine.py, and event_engine.py	PRODUCT 1 PASS on 1 py, 3 tests
Manual analysis	Deduped event_id in events.csv before effort	Cross-checked OS version tests for DECISION.md treating the owner's
Web / vendor docs	Microsoft OneDrive/Dropbox file-request + Microsoft OneDrive/Dropbox file-request	Microsoft OneDrive/Dropbox file-request for the access data in what each source supports

What I did not use: paid LLM API keys, deployment/hosting, real email/SMS/WhatsApp, or customer interviews — consistent with the Track B brief.

Concrete example — issue I caught and fixed

While implementing queue logic, Composer produced an **invalid dataclass update pattern**. **Unit tests failed immediately**. I did not accept the assistant's version; I rewrote the update using **dataclasses.replace**, re-ran **python -m unittest discover -s tests -v**, then **python product1\verify_product1.py** until I saw **PRODUCT 1 PASS**. That sequence is my default gate before I trust AI-generated code in this submission.

How I split work: AI vs my judgment

- **AI (Composer):** speed on boilerplate, tests skeletons, first-pass docs.
- **Me:** business rules, evidence numbers, scope (Product 1 only), and ship criteria.
- **Reject rule:** if verify or tests fail, I fix or revert — I do not “explain away” failing checks.
